Sample 1: Transaction Limits and Approval Rules

Purpose

This fictional policy explains daily transfer limits for a sample financial platform. It is designed for testing PDF ingestion and text chunking. It is not a real bank policy.

1. Standard Customers

Standard customers may initiate up to EUR 5,000 in SEPA transfers per calendar day. A transfer that would take the daily total above EUR 5,000 requires approval before processing. The daily counter resets at midnight UTC.

2. Business Customers

Business customers may initiate up to EUR 50,000 in SEPA transfers per calendar day. Transfers exceeding the daily limit must be reviewed by an authorized approver. Additional checks may apply when the transaction pattern is unusual.

3. International SWIFT Transfers

The sample daily limit for SWIFT transfers is EUR 100,000. Transfers may require compliance review based on destination, transaction purpose, customer risk rating, or applicable legal requirements. The limit does not guarantee that a transfer will be approved.

4. Approval Workflow

When a transfer exceeds a configured limit, the platform marks it as Pending Approval. An authorized reviewer checks the amount, customer category, destination, and supporting information. The reviewer may approve or reject the request. The system records the decision, reviewer identifier, and timestamp.

5. Example Scenarios

Scenario A: A Standard customer has already sent EUR 4,200 in SEPA transfers today and attempts another transfer of EUR 1,000. The new daily total would be EUR 5,200, so approval is required.

Scenario B: A Business customer has sent EUR 12,000 today and attempts EUR 8,000 more. The new total is EUR 20,000, below the sample EUR 50,000 daily limit.

Scenario C: A customer attempts a EUR 120,000 SWIFT transfer. This exceeds the sample EUR 100,000 daily limit and requires review; the platform should not treat the limit as automatic authorization.

6. Metadata for RAG Experiments

Useful metadata fields include source filename, page number, document title, section heading, and document version. When testing splitters, compare whether a chunk preserves the rule and the customer category together.
