Sample 2: Help Desk and Account Troubleshooting Guide

Overview

This fictional guide provides support agents with standard troubleshooting steps for a demonstration account portal. It includes headings, numbered procedures, bullets, and a table to test how PDF loaders handle varied layouts.

Login Problems

Incorrect Password

Ask the user to verify the email address, check Caps Lock, and enter the password again. If the problem continues, use the password reset process. Support agents must never ask a user to send their password in an email or chat.

One-Time Password (OTP) Not Received

1. Confirm that the user entered the correct email address or phone number.
2. Ask the user to check spam or junk folders.
3. Confirm that the OTP has not expired.
4. If necessary, request a new OTP and wait for the configured delivery window.

Document Upload Problems

If a document upload fails, ask the user to check the allowed file types and maximum file size. The portal should show a useful error message rather than silently discarding the upload. A successful upload should display the filename and upload status.

Common Upload Errors

Error	Possible cause	Suggested action
FILE_TYPE_NOT_ALLOWED	The extension is unsupported.	Convert to an allowed format and retry.
FILE_TOO_LARGE	The file exceeds the configured size.	Compress the file or use a smaller scan.
UPLOAD_TIMEOUT	The connection was interrupted.	Check connectivity and retry.
SESSION_EXPIRED	The login session expired.	Sign in again, then upload.

Escalation Rules

Escalate a ticket when the same issue affects multiple users, when a security concern is reported, or when the support agent cannot reproduce the reported behavior. Include the error code, approximate time, browser, operating system, and steps already attempted. Do not include passwords, full payment-card numbers, or authentication secrets in ticket notes.

Ticket Priority

Low: A cosmetic issue with a workaround.
Medium: A feature is impaired for one user.
High: A key workflow is unavailable for multiple users.
Critical: A suspected security incident or widespread outage requiring immediate response.

Practice Questions

Which error code means the file exceeds the configured size? What should an agent do when an OTP is not received? Which details should be included when escalating a ticket?
